

Implement Client Script & UI Policy (Incident)

Phase 2 – Requirement Analysis

2.1 Purpose

The purpose of this phase is to convert the project idea into clear functional and non-functional requirements that can be configured and verified in the ServiceNow **Incident Management** environment.

2.2 Functional Requirements

ID	Requirement
FR-01	The system must provide an Incident form for creating and updating Incident records.
FR-02	A UI Policy must be applied when the Incident Impact is 1 – High .
FR-03	Assignment Group must become mandatory when Impact is High.
FR-04	Reverse if false must restore the configured field behavior when the Impact condition is no longer satisfied.
FR-05	The Urgency field must become read-only when Impact is High through a UI Policy Action.
FR-06	When Impact changes to High, Urgency must automatically be set to High.
FR-07	An informational message must be displayed when the onChange Client Script performs the automatic Urgency update.
FR-08	A High Impact Incident must not be submitted when Assigned To is empty.
FR-09	An error message must be displayed when submission is prevented because Assigned To is empty.
FR-10	Direct changes to the State field through Incident list editing must be prevented.
FR-11	Users must be able to update State through the Incident form.
FR-12	The implemented configurations must be tested under different Incident conditions.

2.3 Non-Functional Requirements

The project should satisfy the following non-functional expectations:

- The configuration should be simple for Incident users to understand.
 - The Client Scripts should respond correctly to the relevant user actions.
 - The UI Policies should provide consistent field behavior.
 - The validation should help prevent incomplete Incident submissions.
 - The configuration should improve consistency of Incident data.
 - The implemented solution should operate within the ServiceNow Incident Management environment.
-

2.4 ServiceNow Requirements

The project requires the following environment and access:

Requirement	Details
Platform	ServiceNow
Application	Incident Management
Table	Incident
Configuration	UI Policies and UI Policy Actions
Scripting	JavaScript
Client Script Types	onChange, onSubmit, onCellEdit
Access	Suitable configuration/admin access
Browser	Modern web browser
Testing Environment	ServiceNow instance

2.5 Configuration Requirements

The project requires the following ServiceNow configurations:

2.5.1 UI Policy

Name: High Impact Control

- Table: Incident
- Condition: Impact is 1 – High
- Active: Yes
- Assignment Group: Mandatory
- Reverse if false: Enabled

2.5.2 UI Policy Action

The UI Policy Action must control the **Urgency** field.

- Field: Urgency
- Read-only: Yes
- Visible: Unchanged

2.5.3 onChange Client Script

Name: Auto set urgency for high impact

The script must run when the **Impact** field changes and automatically set Urgency to High when Impact is High.

2.5.4 onSubmit Client Script

Name: Prevent save if Assigned To missing

The script must check whether Impact is High and Assigned To is empty. If both conditions are satisfied, the Incident submission must be prevented.

2.5.5 onCellEdit Client Script

Name: Prevent state change via list edit

The script must prevent users from changing the **State** field directly through Incident list editing.

2.6 Requirement Analysis Acceptance Points

The project requirements are considered satisfied when:

- The Incident form is available for testing.
- High Impact activates the configured UI Policy.

- Assignment Group becomes mandatory for High Impact Incidents.
 - Urgency becomes read-only when the UI Policy condition is satisfied.
 - Urgency is automatically set to High when Impact changes to High.
 - A High Impact Incident cannot be submitted with an empty Assigned To field.
 - The appropriate validation message is displayed.
 - Direct State changes through list editing are blocked.
 - State changes through the Incident form are allowed.
 - The implemented configurations operate according to the defined requirements.
-

2.7 Requirement Analysis Output

The requirement analysis establishes the functional and non-functional requirements needed to implement the **Implement Client Script & UI Policy (Incident)** project.

These requirements provide the basis for the next phase, **Project Design**, where the ServiceNow components, configuration flow, and implementation structure are defined.
